

ABDULLAH BUENO

BACKEND | SOFTWARE ENGINEER

I am a backend developer with proven experience in designing and building RESTful APIs, authentication systems, and payment integrations across web and mobile platforms. Having delivered production-level backends — from data-driven PHP services to serverless NestJS architectures — I bring a strong understanding of API design, data integrity, and system reliability to shape the end user experience.

EXPERIENCE

Software Engineer (Part Time)
Binary Holdings Group | Dec 2023 – April 2026

- Designed and deployed an internal email server with SSL/TLS certificate authority configuration.
- Configured and maintained an Nginx reverse proxy server to route and expose RESTful and SOAP API integrations across multiple project stacks, simulating real-time middleware traffic management for prototype environments.
- Enforced secure data delivery through API gateway configuration, applying encryption standards, credential management, and authentication schemes across deployment pipelines.
- Consulted directly with clients to gather and scope backend integration requirements, translating business needs into structured API and service architecture specifications supporting cross-system data flows.

Software Engineer (Contracted)
Goodnewsy.org | Web-Based Trivia Game | Jun 2024 – July 2025

- Built and deployed Node.js-based API routes in Next.js environment, handling server-side authentication and structured content delivery.
- Engineered a scalable RESTful WordPress plugin serving as a headless CMS API, delivering trivia content and handling authentication.
- Configured Cloudflare as an API gateway later for traffic routing, load balancing, and domain management, ensuring global delivery performance and availability.
- Scoped an AWS deployment pipelines to support continuous delivery of backend services.

Software Engineer (Contracted)
Paff.org | Columbia, SC | Dec 2023 – May 2024; Nov 2024 – April 2026

- Designed and built a PHP API that sanitized and transformed third-party data for a mobile application.
- Developed a RESTful backend managing user authentication, tier subscription access, and stripe payment processing — including webhook listeners to enforce transactional integrity across payment events.
- Optimized API response performance through code refactoring and efficient data handling, reducing load times across endpoints.
- Built and exposed RESTful endpoints for a favorites feature, integrating cleanly with existing authentication and data access layers.

Software Engineer (Contracted)
University of Personal Fitness | Columbia, SC | April 2022 – Nov 2025

- Deployed a serverless Node.js backend using NESTJS on Google Cloud Functions, managing client data, administrative authentication, student belt progression tracking, class attendance.
- Designed custom middleware pipelines and request processing logic for authentication enforcement, data validation, and service routing.
- Built and deployed a client-management web application backed by secure API services with secure authentication and data protection to safeguard sensitive information.

Education

BA in Computer Science
University of South Carolina | 2019 – 2023

Minor in Business
University of South Carolina | 2019 - 2023

Google Android Studio Developer
University of South Carolina | Certification | 2022

Skills

Attention to Detail
Time Management
Critical Thinking
Problem Solving
Communication
Creative Thinking
Adaptability

Technologies

JavaScript/TypeScript	React
Java	Angular
C++	NextJS
C#	Node
SQL	Git
PHP	Google Cloud
Python	WordPress
